

# Inayat — Stage Script

What to actually say, slide by slide — read once out loud before you go up

*Six slides, about five minutes. Don't read bullets off the slide — say these in your own words. Green boxes = say it loud and slow. Italic lines = pause.*

## SLIDE 1 — Title

“Good [morning/afternoon], judges. We are Team SANKALP, presenting our solution for Problem Statement SIH26-CC-0032 — Patient Case-Taking Software.”

*[PAUSE — let the slide sit for 2 seconds before talking]*

## SLIDE 2 — Problem Statement & Idea

“Let's start with one number.

**(SAY THIS SLOWLY, LOUD, PAUSE AFTER)**

**“In an Indian OPD, a doctor spends about two minutes with each patient.”**

*[PAUSE 1 second — let it land]*

“Two minutes to listen, examine, and decide. But research shows 70 to 80 percent of a correct diagnosis comes from the history alone — before any test. So the two minutes doctors have the least of is exactly the two minutes that matters most.

Patients bring torn, unstructured old prescriptions. Elderly, rural, and low-literacy patients get left out of most digital tools. Doctors end up repeating the same basic questions every single time.

That's the real problem. Our idea:

**(SAY THIS LOUD AND CLEAR)**

**“INAYAT lets a patient describe their problem — by typing, by speaking in their own language, or by photographing an old prescription — and turns it into a clean, physician-ready history. Before the doctor even walks in.”**

*[PAUSE, then move to next slide]*

## SLIDE 3 — Proposed Solution

“INAYAT means 'care' in Urdu. We named it that on purpose — the whole prototype exists to give every patient the caring attention a two-minute visit can't.”

*[PAUSE 1 second]*

“Five things make this real, not just a chatbot:

Multilingual voice, so language is never a barrier. Adaptive questioning — a cough gets different follow-ups than a rash. Safety-first triage that runs before anything else. Smart document reading from old prescriptions. And AYUSH-aware history, for Ayurvedic consultations too.

**(POINT AT THE SCREEN / QR CODE HERE)**

“This is a live, working prototype — not a mockup. The link is right there if you want to open it yourself.”

“We're not just a chatbot, and we're not just a form. We're the only one doing all four of these together.”

## SLIDE 4 — Technical Feasibility

---

“Quickly on how it's built — real technology, not vapor.

Frontend is plain HTML and JavaScript, on purpose, so it loads fast on a cheap phone with a weak connection. Backend is Python and FastAPI with SQLite. Claude does the language reasoning, backed by our own TF-IDF safety check. Tesseract reads old prescriptions. Bhashini and offline speech tools handle voice. And we connect to ABDM — India's real government health-ID system — with real OTP and encryption, not a mock.”

*[PAUSE — don't linger here, judges skim tech slides fast]*

“Everything on this slide is running in the live prototype right now.”

## SLIDE 5 — Impact and Benefits

---

“What does this actually change?

For patients — voice access in their own language, even elderly or low-literacy patients, and it still works with weak or no internet.

For doctors — the history is ready before they walk in. Less repeating, more time to actually examine and think.

And here's the one judges usually ask about:

**(SAY THIS CLEARLY)**

**“Our safety-critical checks run with zero API cost — they work even if the AI service is down. That's what makes this scale to a real, high-volume government hospital, not just a demo.”**

## SLIDE 6 — Research and References

---

“Last thing — we didn't guess any of this. The two-minute consultation figure is from a real BMJ Open study across 67 countries. Our AYUSH questions are cross-checked against real Dashavidha Pariksha references. And our health-ID integration follows ABDM's actual published API and encryption spec.”

*[PAUSE]*

**(CLOSING LINE — SAY SLOWLY, MAKE EYE CONTACT)**

**“INAYAT listens to a patient before the doctor does, and turns that into a safe, organized note — so the doctor's two minutes go to deciding, not repeating questions. Thank you.”**

*[PAUSE for questions]*

---

### **If you forget everything else, remember these 3 lines**

- 1 “A doctor gets two minutes. History gives 70–80% of the diagnosis.”
- 2 “INAYAT means care — we built it to give that two minutes back.”
- 3 “Zero-API-cost safety checks. Real government health-ID. Live, not a mockup.”
